1. Introduction

In a school environment, students may encounter situations that need to be reported to school administrators or shared with other students, such as emergencies, incidents, lost belongings, found items, and other school-related concerns. Students may currently use informal communication channels, such as the official social media page of the school, to report or share information about these situations. While social media provides an accessible way to communicate, it is not specifically designed for organizing and managing school reports.

Using general social media platforms for reporting can make it difficult to maintain a consistent and organized reporting process. Important information may be presented differently from one report to another, while submitted posts can become difficult to track as new posts and other content are added. Administrators may also need to manually review and manage reports, which can make the process less efficient and organized.

To address these concerns, SwiftTrack is proposed as a centralized web-based reporting system designed for students and school administrators. Students will be able to submit reports containing a title, description, category, and supporting image. Submitted reports will first undergo administrative review before being either approved or rejected. Approved reports will be displayed on a centralized feed where students can view relevant school reports, while rejected reports will remain inaccessible from the public feed and their status can be viewed by the submitting student.

2. Purpose of the Project

This proposal aims to present a web-based reporting application that will address the lack of a centralized and structured platform for student reports, streamline the submission and administrative review process, and improve the organization and accessibility of school-related reports for students and school administrators.

The system will provide students with a dedicated platform for submitting reports instead of relying primarily on general social media platforms. It will also provide administrators with a centralized interface for reviewing submitted reports and determining whether they should be approved or rejected. Approved reports will be published to the system's feed, allowing students to view relevant reports in an organized manner.

3. Objectives

3.1 General Objective

To design and develop SwiftTrack, a web-based school reporting and management system that provides students with a centralized platform for submitting school-related reports and administrators with an organized system for reviewing, publishing, and managing those reports.

3.2 Specific Objectives

- To develop a web-based system that allows students to submit school-related reports containing a title, description, category, and supporting images.
- To provide students with the ability to view their submitted reports and track their current status.
- To provide administrators with an interface for viewing, reviewing, approving, or rejecting submitted reports.
- To provide search and filtering functions that allow users to find relevant approved reports based on keywords or categories.
- To implement report status management that supports the progression of reports from submission and administrative review to approval and resolution.
- To improve the organization and management of reports through structured data storage and database management.

4. Project Scope

4.1 In Scope

- Student account registration and login.
- Secure user authentication and access control.
- Submission of school-related reports.
- Report title and description fields.
- Report categorization, such as Lost & Found, Incident, and Emergency.
- Administrative dashboard for managing reports.
- Resolution status for reports that have been addressed or completed.
- Responsive and user-friendly web interface.

4.2 Out of Scope

- Development or procurement of dedicated hardware.
- Automated emergency response or physical intervention.
- Real-time communication with emergency services.
- Replacement of existing official school emergency procedures.
- Automatic verification of the accuracy or truthfulness of submitted reports.

5. System Features / Functions

Module	Feature	Description
User Management	Registration & Login	Allows students and administrators to securely create accounts and log in with role-based access.
User Management	Profile Management	Allows users to view and update their personal information.
Report Management	Report Submission	Allows students to submit school-related reports by providing a title, description, category, and supporting image.
Report Management	Report Status Tracking	Allows students to view the current status of their submitted reports, such as Pending, Approved, Rejected, or Resolved.
Report Feed	Approved Reports Feed	Displays approved reports in a centralized feed where students can view relevant school-related reports.
Administration	Report Review	Allows administrators to review submitted reports and approve or reject them based on the provided information.
Administration	Admin Dashboard	Provides administrators with an overview of submitted reports and their current statuses.

6. Technology Stack

Layer	Technology / Tool	Purpose
Frontend (Web)	HTML, Tailwind CSS, JavaScript	User interface and client-side functionality
Backend / API	Supabase API	Communication between the web application and backend services
Database	Supabase PostgreSQL	Stores user accounts, reports, categories, and statuses
Cloud / Hosting	Agila Host	Deployment and hosting environment of SwiftTrack
Version Control	Git / GitHub	Source code management
Project Management Tool	Jira / Notion	Task tracking and team collaboration
Other Tools	Figma for UI/UX	Supporting development tools

7. Target Users

User Role	Description	Key Needs / Usage
Admin	School administrator responsible for reviewing and managing submitted reports.	Review, approve, reject, and resolve reports; manage users; monitor report statuses.
Primary User - Student	Students who use SwiftTrack to submit and view school-related reports.	Submit reports, upload supporting images, track report status, and view approved reports through the centralized feed.

8. Project Timeline / Work Plan

Phase	Activities	Estimated Duration
Planning & Requirements Gathering	Define system requirements, user roles, report workflow, and system features.	1–2 weeks
System Design	UI/UX design, database design, system architecture, and report workflow design.	1–2 weeks
Development	Develop the frontend, integrate Supabase, implement authentication, report submission, admin review, feed, search/filtering, and status management.	4–6 weeks
Testing & QA	Test system functions, user roles, report workflow, database operations, and responsiveness.	2 weeks
Deployment	Deploy the system to Agila Host, configure SSL/domain, connect Supabase, and perform final deployment testing.	1 week
Project Presentation	Presentation of project	1 week
